

The mobile system for recognizing, intercepting and fighting unidentified drones

Description:

- Complex protection of airspace through a properly coordinated system
- The system detects, interferes, intercepts and/or destroys unidentified drones which entered the protection-covered area

Characteristics:

- The system successfully detects and classifies unidentified drones before they reach the protected territory
- Depending on the results of earlier detection, proper procedures and preventive measures are launched
- The drones independently locate the target, the operator makes the decision

Competitive advantages:

- Lack of effective anti-drone shield on the world market
- Cost-effective
- Intercepts every flying object

Application:

- The army
- VIPs and mass events protection
- Property protection
